

INDOOR HYDRO/SOIL NUTRIENT ACTIVATOR

The Missing Link in all Indoor Growing Operations is the Complex Array of Organic Acids and Trace Minerals Available to Plants when Grown in Healthy Soils.

Some 34 million years ago enormous rainforests covered much of the earth. Like the animals of that time, plants were enormous compared to the plants of today, with root systems that reached deep into the earth. The root systems of these prehistoric giants were able to tap rich sources of inorganic minerals, which the plants then converted into organic, biologically-friendly minerals via photosynthesis. Once these giant plants died, the organic minerals within their structures were deposited onto the surface of the earth, where they were combined with fulvic acids created by the local soil microbes. This botanical life and death cycle continued for millions of years, gradually forming rare Fulvic Mineral deposits. Prehistoric plant matter deposits that are easily accessible are very rare. They contain highly bio-available minerals, trace elements; trace minerals, amino acids and fulvic acid nature's miracle molecule.

No matter what nutrient solution or specialized formula you are currently using for your hydroponic growing operation, AgToniks Nutrient Activator will substantially increase nutrient uptake by your plants on a cellular level. This results in impressive benefits;

1. Faster vegetative growth -
2. Improves nitrogen uptake -
3. Makes more of the oxygen in the water available to plants -
4. Better resistance to diseases -
5. Improved resistance to pests -
6. Noticeable increase in growth rate -
7. Thicker, greener healthier vegetation -
8. Thicker more abundant flowering -
9. Increases flowering on lower stems of the plants where bud development is usually sparse.
10. Higher THC content --
11. Maximum light conversion resulting in larger healthier plants -
12. Bigger buds and bigger yields!
13. Earlier flowering -

These specialized fulvic minerals having passed through the roots of prehistoric plants are thus converted to extremely biologically active molecules that make plants grow wild!

There is nothing quite like this product -- we harvest these rare prehistoric minerals from our very own deposit located in the southern USA. Once you experience growing your plants with our Nutrient Activator you will never want to grow without it -- it's that effective

Important Considerations -

Most of the fulvic acid products available on the market are what we refer to as “1st generation” fulvic acid since it was “man-made” by the fermentation of peat. This cannot compare to fulvic acid that has been formed over millions of years of composting! The complex combination of naturally occurring minerals, fulvic acids, humic acid, trace minerals, trace elements and amino acids cannot be found in other products.

Our Nutrient Activator will increase the uptake of nitrogen by at least 20% -- it may become necessary during the growth cycle to reduce the amount of nitrogen being given. Fulvic acid has the ability to convert inorganic nitrogen and other synthetic nutrients into an organic form. If yellowing of the tips of the leaves shows up early in the growth cycle be sure to reduce nitrogen.

Since most growers use nutrient combinations that contain many ingredients including nitrogen **we suggest** reducing the amount of nutrient additive you are currently using by 10% to 20% -- our Nutrient Activator will also increase the uptake of all other nutrients -- this can save the grower (especially the large grower) substantial amounts of money.
